

FP CARMIGNAC GLOBAL BOND B GBP ACC HDG

OEIC

Recommended minimum investment horizon:

GB00BJHPZ502

Monthly Factsheet - 31/07/2024

INVESTMENT OBJECTIVE

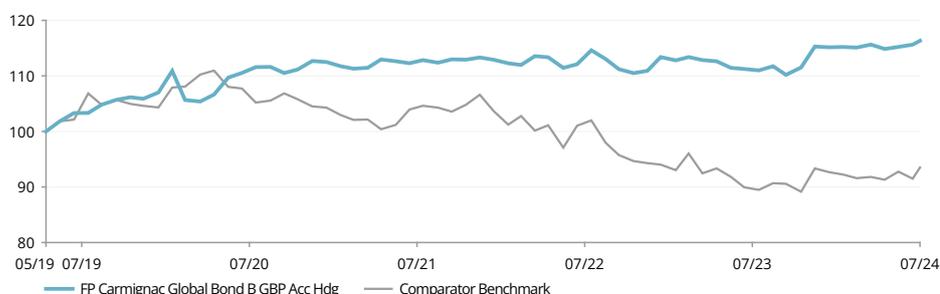

A global fixed income fund aiming to achieve capital growth and income over a period of at least two years by implementing interest rate, credit and currency strategies. Its flexible and conviction-driven approach enables the Fund to seize tactical opportunities on bond markets, with no geographical region, business sector, or company size constraint.

Fund Management analysis can be found on P.3

FUND MANAGEMENT ANALYSIS

MARKET ENVIRONMENT

- In July, we observed a significant development in the US job market, with a decrease in private sector hiring and an increase in the unemployment rate. Additionally, the CPI June data published in July surprised to the downside for both the headline and core inflation.
- Moreover, we believe that the global economy is experiencing a slowdown trend, driven by China's weak domestic economy and Europe's struggling manufacturing sector, although the services sector is holding up relatively well.
- Hence, interest rate strategies performed remarkably well during the month, with the US Treasury yield decreasing by approximately 50 basis points during the month, while the German bund yield decreased by 40 basis points.
- Credit spreads continued to tighten, with the Itraxx Xover index tightening by an additional 23 basis points.
- Within emerging markets, the month proved to be positive for both local and hard currency debt. This positive movement was primarily driven by a more dovish rhetoric from the Federal Reserve and the increasing likelihood of interest rate cuts in September.
- In July, the market also factored in a 15 basis points interest rate hike by the Bank of Japan, resulting in a significant appreciation of the Japanese Yen. This move also benefited some Asian currencies. Lastly, during the month, the US Dollar experienced a slight decline against the Euro, despite an upward move in the final 10 days.
- Lastly, during the month, the US Dollar experienced a slight decline against the Euro, despite an upward move in the final 10 days.

PERFORMANCE COMMENTARY

- The fund achieved a strong positive absolute performance, although it fell short of its reference index.
- Our long rate strategies, whether focused on the US curve or EM local rates, made a positive contribution to the fund's performance. The main contributors in the local rate space were Brazilian, Mexican, and Czech rates.
- Similarly, our investments in external debt had a positive impact on the fund's performance, driven by movements in US rates.
- Additionally, our corporate credit holdings also contributed positively, despite some protective measures in this area.
- Lastly, the fund's performance was affected by currency movements this month. Our long position in the USD and short position in the CNY had a negative impact, while our long position in the Australian Dollar had a positive impact.

OUTLOOK AND INVESTMENT STRATEGY

- Given the current market conditions, we anticipate that duration assets will continue to perform well. That is why we increased our duration above 5 at the end of the month.
- The upcoming interest rate cuts by the FED and the ongoing easing cycle by the ECB create a favorable environment for EM central banks to initiate or continue their own easing policies.
- Hence throughout the month, we added on to our exposure to US duration.
- We also raised our local rate exposure to approximately 100 basis points, with our strongest convictions in Mexico, Brazil, and the Czech Republic. These countries have high real interest rates and a downward trend in inflation.
- We maintain a positive outlook on external currency debt, particularly in specific idiosyncratic stories like Colombia or Pemex, as well as structural names such as Romania and Ivory Coast. However, we exercise caution in the corporate credit space, with around 15% of credit protections on the Itraxx Xover.
- Lastly, we remain cautious on EM currencies, with our main convictions lying in the Brazilian real, Chilean peso, and Korean won. While we maintain a positive view on the US dollar, we have also increased our long position in the Japanese yen, which has finally started to deliver the expected results.

GLOSSARY

Alpha: Alpha measures the performance of a portfolio compared to its reference indicator. Negative alpha means the fund performed less well than its reference indicator (e.g. if the indicator increased by 10% in one year and the fund increased by only 6%, its alpha is -4). Positive alpha means the fund performed better than its reference indicator (e.g. if the indicator increased by 6% in one year and the fund increased by 10%, its alpha is 4).

Beta: Beta measures the relationship between the fluctuations of the net asset values of the fund and the fluctuations of the levels of its reference indicator. Beta of less than 1 indicates that the fund “cushions” the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index falls by 10%). Beta higher than 1 indicates that the fund “magnifies” the fluctuations of its reference indicator (beta = 1.4 means that the fund increases by 14% when the index increases by 10% but also decreases by 14% when the index decreases by 10%). Beta of less than 0 indicates that the fund reacts inversely to the fluctuations of its reference indicator (beta = -0.6 means that the fund falls by 6% when the index increases by 10% and vice versa).

Capitalisation: A company's stock market value at any given moment. It is obtained by multiplying the number of shares of a company by its stock exchange price.

Duration: A bond's duration is the period beyond which interest rate variations will no longer affect its return. The duration is like a discounted average lifetime of all flows (interest and capital).

High yield: A loan or bond rated below investment grade because of its higher default risk. The return on these securities is generally higher.

Investment grade: A loan or bond that rating agencies have rated AAA to BBB-, generally indicating relatively low default risk.

Investment/net exposure rate: The investment rate constitutes the volume of assets invested expressed as a percentage of the portfolio. Adding the impact of the derivatives to this investment rate results in the net exposure rate, which corresponds to the real percentage of asset exposure to a certain risk. Derivatives can be used to increase the underlying asset's exposure (stimulation) or reduce it (hedging).

Modified duration: A bond's modified duration measures the risk attached to a given change in the interest rate. Modified duration of +2 means that for an instantaneous 1% rate increase, the portfolio's value would drop by 2%.

Net asset value: Price of all units (in an FCP) or shares (in a SICAV).

Rating: The rating measures the creditworthiness of a borrower (bond issuer).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of this return. It thus shows the marginal return per unit of risk. When it is positive, the higher the Sharpe ratio, the more risk-taking is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio posted a negative performance, but rather that it performed worse than a risk-free investment.

Unconstrained approach: This is an active approach that is unconstrained by any reference indicator, thereby allowing greater flexibility in terms of exposure management and enabling the Fund to face extremely varied market environments.

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a financial asset portfolio, based on a holding period (20 days) and confidence interval (99%). This potential loss is expressed as a percentage of the portfolio's total assets. It is calculated on the basis of a sample of historical data (over a two-year period).

Volatility: Range of price variation of a security, fund, market or index, which enables the measurement of risk over a given period. It is determined using the standard deviation obtained by calculating the square root of the variance. The variance is obtained by calculating the average deviation from the mean, which is then squared. The greater the volatility, the greater the risk.

Yield to Maturity: Yield to Maturity (YTM) is the estimated annual rate of return expected on a bond if held until maturity and assuming all payments made as scheduled and reinvested at this rate. For perpetual bonds, the next call date is used for computation. Note that the yield shown does not take into account the FX carry and fees and expenses of the portfolio. The portfolio's YTM is the weighted average individual bonds holdings' YTM within the portfolio.

MAIN RISKS OF THE FUND

CREDIT: Credit risk is the risk that the issuer may default. **INTEREST RATE:** Interest rate risk results in a decline in the net asset value in the event of changes in interest rates. **CURRENCY:** Currency risk is linked to exposure to a currency other than the Fund's valuation currency, either through direct investment or the use of forward financial instruments. **DISCRETIONARY MANAGEMENT:** Anticipations of financial market changes made by the Management Company have a direct effect on the Fund's performance, which depends on the stocks selected.

The Fund presents a risk of loss of capital.
